

This application note provides a set of checklists that consist of design guidelines, recommendations, and factors to consider when you create designs using the MAX® 10 FPGAs.

- Use this document to help you plan the FPGA and system early in the design process, which is crucial for a successful design.
- Follow Altera's recommendations throughout the design process to achieve good results, avoid common issues, and improve your design productivity.

Figure 1 shows the MAX 10 design flow. The sections in this document provide the checklists and guidelines for each part of the design flow.

Figure 1. MAX 10 Design Flow

Before You Begin

Before you begin planning and designing your FPGA system, familiarize yourself with the FPGA device features, and the design tools and IP that are available for the MAX 10 device family.

Table 1. Prerequisites Checklist

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Read through the Device Overview of the FPGA</i></p> <p>The Device Overview provides an overview of the capabilities and options available for a device family. Read through the document to familiarize yourself with the device family offerings and general features.</p> <p>For an overview of each FPGA device family, refer to the MAX 10 FPGA Device Overview.</p>
2.	<input type="checkbox"/>	<p><i>Estimate design requirements</i></p> <p>Create a rough estimate of the design in the following terms:</p> <ul style="list-style-type: none"> ■ Basic functions of the product ■ Similar previous designs ■ General device requirements
3.	<input type="checkbox"/>	<p><i>Review available design tools</i></p> <p>Consider the available design, estimators, system builders, and verification tools. The following items are some of the available tools provided by Altera:</p> <ul style="list-style-type: none"> ■ Quartus® II software for design, synthesis, simulation, and programming; including integration with Qsys, simulation tools, and verification tools. ■ Qsys system integration tool—next generation SOPC Builder that automatically generates interconnect logic to connect intellectual property (IP) functions and subsystems. ■ Mentor Graphics® ModelSim®-Altera® simulation software. ■ TimeQuest Timing Analyzer for static timing analysis with support for Synopsys® Design Constraints (SDC) format. ■ PowerPlay Power Analyzer for power analysis and optimization. ■ SignalProbe and SignalTap II Logic Analyzer debugging tools. ■ External Memory Interface Toolkit available in the Quartus II software. <p>For more information, visit the following pages on the Altera website:</p> <ul style="list-style-type: none"> ■ Design Tools & Services ■ Design Software Support <p>For a guideline to migrate from SOPC Builder to Qsys, refer to AN 632: SOPC Builder to Qsys Migration Guidelines.</p>
4.	<input type="checkbox"/>	<p><i>Review available IP</i></p> <p>Altera and its third-party IP partners offer a large selection of parameterized blocks of IP cores optimized for Altera devices that you can implement to reduce your implementation and verification time.</p> <p>Based on your estimated requirements, refer to the All Intellectual Property page on Altera's website to check if there are available IP that can provide the functions that you need.</p>

Design Specifications

Typically, the FPGA is an important part of the overall system and affects the rest of the system design. Use the following checklist to start your design process.

Table 2. Design Specifications Checklist

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Create detailed design specifications</i></p> <p>Before you create your logic design or complete your system design, perform the following:</p> <ul style="list-style-type: none"> ■ Specify the I/O interfaces for the FPGA ■ Identify the different clock domains ■ Include a block diagram of basic design functions ■ Consider a common design directory structure—if your design includes multiple designers, a common design directory structure eases the design integration stages. ■ When performing any UFM write or erase operation, make sure you provide stable power connection. Loss of power supply during a write or erase operation can cause damage to the device.
2.	<input type="checkbox"/>	<p><i>Create detailed functional verification or test plan</i></p> <p>A functional verification plan ensures the team knows how to verify the system. Creating a test plan at an early stage helps you design for testability and manufacturability.</p> <p>For example, if you plan to perform built-in-self test (BIST) functions to drive interfaces, you can plan to use a UART interface with a Nios® II processor inside the FPGA device.</p> <p>For more information, refer to “Review available on-chip debugging tools” on page 7.</p>
3.	<input type="checkbox"/>	<p><i>Select IP that affects system design, especially I/O interfaces</i></p> <p>Include intellectual property (IP) blocks in your detailed design specifications. Taking the time to create these specifications improves design efficiency.</p> <p>For a list of available IP offered by Altera and third-party IP partners, refer to the All Intellectual Property page on Altera’s website.</p>
4.	<input type="checkbox"/>	<p><i>Ensure your board design supports the OpenCore Plus tethered mode</i></p> <p>You can program your FPGA and verify your design in hardware before you purchase an IP license by using the OpenCore Plus feature available for many IP cores. OpenCore Plus supports the following modes:</p> <ul style="list-style-type: none"> ■ Untethered—your design runs for a limited time. ■ Tethered—your design runs for the duration of the hardware evaluation period. This mode requires an Altera download cable connected to the JTAG port on your board and a host computer that runs the Quartus II Programmer. If you plan to use this mode, ensure that your board design supports this mode.
5.	<input type="checkbox"/>	<p><i>Review available system development tools</i></p> <p>For more information, visit the following pages on the Altera website:</p> <ul style="list-style-type: none"> ■ Design Tools & Services ■ Design Software Support

Device Selection

Use the following checklist to determine the device variant, density, and package combination that is suitable for your design.

Table 3. Device Selection Checklist (Part 1 of 3)

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Consider the available device variants</i></p> <p>The MAX 10 device family consist of several device variants that are optimized for different application requirements.</p> <p>Select a device based on I/O pin count, LVDS channels, package offering, logic/memory/multiplier density, single/dual supply device options, PLLs, clock routing, and speed grade.</p> <p>Consider the following feature options:</p> <ul style="list-style-type: none"> ■ Compact ■ Flash ■ Analog-to-digital converter (ADC) <p>For more information, refer to the MAX 10 FPGA Device Overview.</p>
2.	<input type="checkbox"/>	<p><i>Estimate the required logic, memory, and multiplier density</i></p> <p>MAX 10 devices offer a range of densities that provide different amounts of device logic resources. Determining the required logic density can be a challenging part of the design planning process. Devices with more logic resources can implement larger and potentially more complex designs but generally have a higher cost. Smaller devices have lower static power utilization.</p> <p>For more information, refer to the MAX 10 Embedded Multipliers User Guide.</p>
3.	<input type="checkbox"/>	<p><i>Consider vertical device migration availability and requirements</i></p> <p>Determine whether you want the flexibility of migrating your design to another device density. Choose your device density and package to accommodate any possible future device migration to allow flexibility when the design nears completion.</p> <p>To verify the pin migration compatibility, use the Pin Migration View window in the Quartus II software Pin Planner. The Pin Migration View window helps you identify the difference in pins that can exist between migration devices:</p> <ul style="list-style-type: none"> ■ If one device has pins for connection to V_{CC} or GND but are I/O pins on a different device, the Quartus II software ensures these pins are not used for I/O. For migration, ensure that these pins are connected to the correct PCB plane. ■ If you are migrating between two devices in the same package, connect the pins that are not connected to the smaller die to V_{CC} or GND on the larger die in your original design. <p>For more information about verifying the pin migration compatibility, refer to the Managing Device I/O Pins chapter of the <i>Quartus II Handbook</i>.</p>

Table 3. Device Selection Checklist (Part 2 of 3)

No.	✓	Checklist items
4.	<input type="checkbox"/>	<p><i>Review resource utilization reports of similar designs</i></p> <p>If you have other designs that target an Altera device, you can use their resource utilization as an estimate for your new design. Coding style, device architecture, and optimization options used in the Quartus II software can significantly affect resource utilization and timing performance of a design.</p> <p>To estimate resource utilization for certain configurations of Altera's IP designs, refer to the respective MAX 10 user guides.</p>
5.	<input type="checkbox"/>	<p><i>Reserve device resources for future development and debugging</i></p> <p>Select a device that meets your design requirements with some safety margin in case you want to add more logic later in the design cycle, upgrade, or expand your design. You may also want additional space in the device to ease design floorplan creation for an incremental or team-based design.</p> <p>Consider reserving resources for debugging, as described in “Consider the guidelines to plan for debugging tools” on page 8.</p>
6.	<input type="checkbox"/>	<p><i>Estimate the number of I/O pins that you require</i></p> <p>Determine the required number of I/O pins for your application, considering the design's interface requirements with other system blocks. You can compile any existing designs in the Quartus II software to determine how many I/O pins are used.</p> <p>Other factors can also affect the number of I/O pins required for a design, including simultaneous switching noise (SSN) concerns, pin placement guidelines, pins used as dedicated inputs, I/O standard availability for each I/O bank, differences between I/O standards and speed for row and column I/O banks, and package migration options.</p> <p>For more details about choosing pin locations, refer to relevant topics under “Board Design” on page 6 and “I/O and Clock Planning” on page 16.</p>
7.	<input type="checkbox"/>	<p><i>Consider the I/O pins you need to reserve for debugging</i></p> <p>Consider reserving I/O pins for debugging, as described in “Consider the guidelines to plan for debugging tools” on page 8.</p>
8.	<input type="checkbox"/>	<p><i>Verify that the number of LVDS channels are enough</i></p> <p>Larger densities and package pin counts offer more full-duplex LVDS channels for differential signaling. Ensure that your device density-package combination includes enough LVDS channels.</p>
9.	<input type="checkbox"/>	<p><i>Verify the number of PLLs and clock routing resources</i></p> <p>Verify that your chosen device density package combination includes enough PLLs and clock routing resources for your design. GCLK resources are shared between certain PLLs, which can affect the inputs that are available for use.</p> <p>For more details and references regarding clock pins and global routing resources, refer to “I/O and Clock Planning” on page 16.</p>

Table 3. Device Selection Checklist (Part 3 of 3)

No.	✓	Checklist items
10.	<input type="checkbox"/>	<p><i>Determine the device speed grade that you require</i></p> <p>The device speed grade affects the device timing performance and timing closure, as well as power utilization. One way to determine which speed grade your design requires is to consider the supported clock rates for specific I/O interfaces.</p> <p>For information about supported clock rates for memory interfaces using I/O pins on different sides of the device in different device speed grades, use the estimator tool on the External Memory Interface Spec Estimator page.</p> <p>You can use the fastest speed grade while prototyping to reduce compilation time because less time is spent optimizing the design to meet timing requirements. If the design meets the timing requirements, you can then move to a slower speed grade for production to reduce cost.</p> <p>When migrating to a device of different speed grade, check the timing report from the timing analysis to ensure that there is no timing violation between different blocks within the MAX 10 device, between MAX 10 devices and other devices on the board.</p> <p>Always design with a sufficient timing margin so that your design can work on devices of different speed grades.</p> <p>For information about the available speed grades, refer to the MAX 10 FPGA Device Datasheet.</p>
11.	<input type="checkbox"/>	<p><i>Determine the number of images supported for the device</i></p> <p>Select a device that support dual configuration images, two FPGA bitstreams, if dual configuration feature is needed in your design. All MAX 10 devices support the dual configuration feature, except 10M02 device.</p>

Board Design

Use the checklists in this section as guidelines to design your board.

Early Board Design

Early planning allows the FPGA team to provide early information to PCB board and system designers.

Table 4. Early Board Design Planning Checklist (Part 1 of 4)

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Select a configuration scheme</i></p> <p>For information about the internal configuration scheme, and the necessary and optional pin settings, refer to the MAX 10 FPGA Configuration User Guide.</p>

Table 4. Early Board Design Planning Checklist (Part 2 of 4)

No.	✓ Checklist items
2.	<p data-bbox="503 296 987 327"><input type="checkbox"/> <i>Ensure board support the required features:</i></p> <ul style="list-style-type: none"> <li data-bbox="548 338 1421 432">■ Data decompression—if you enable data compression, the storage requirement and the programming time (writing to flash) are reduced. The configuration time (writing to CRAM) is increased. <li data-bbox="548 443 1421 558">■ Design security—this feature utilizes a 128-bit security key to protect the designs from unauthorized copying, reverse engineering, and tampering. The devices can decrypt configuration bitstreams using the AES algorithm. Design security is not available for the JTAG configuration scheme. <li data-bbox="548 569 1317 600">■ Dual configuration—this feature is supported only in self-download mode. <li data-bbox="548 611 1421 768">■ SEU mitigation—dedicated circuitry in the devices perform cyclic redundancy check (CRC) error detection and check for SEU errors automatically. To detect SEU errors, use the <code>CRC_ERROR</code> pin to flag errors and design your system to take appropriate action. If you do not enable the CRC error detection feature, you can also use the <code>CRC_ERROR</code> pin as a design I/O pin. <p data-bbox="548 779 1292 808">For more information, refer to the MAX 10 FPGA Configuration User Guide.</p>
3.	<p data-bbox="503 835 1117 867"><input type="checkbox"/> <i>Plan for the Auto-restart after configuration error option</i></p> <p data-bbox="548 877 1421 1035">To reset the device internally by driving the <code>nSTATUS</code> pin low when a configuration error occurs, enable the Auto-restart after configuration error option. The device releases its <code>nSTATUS</code> pin after the reset time-out period. This behavior allows you to re-initiate the configuration cycle. The <code>nSTATUS</code> pin requires an external 10-kΩ pull-up resistor to V_{CCIO}.</p>
4.	<p data-bbox="503 1062 876 1094"><input type="checkbox"/> <i>Estimating configuration file size</i></p> <p data-bbox="548 1104 1421 1188">To estimate the configuration file size, convert your configuration file in uncompressed Raw Binary File (.rbf). The .rbf file size provides the approximate uncompressed configuration file sizes.</p> <p data-bbox="548 1199 1421 1293">Use uncompressed .rbf size only to estimate the file size before design compilation. Different configuration file formats, such as Hexadecimal (Intel-Format) File (.hex) or Tabular Text File (.tff) format, have different file sizes.</p> <p data-bbox="548 1304 1421 1367">For more information on the uncompressed .rbf sizes for MAX 10 devices, refer to the MAX 10 FPGA Configuration User Guide.</p>
5.	<p data-bbox="503 1394 964 1425"><input type="checkbox"/> <i>Review available on-chip debugging tools</i></p> <p data-bbox="548 1436 1421 1499">Take advantage of on-chip debugging features to analyze internal signals and perform advanced debugging techniques.</p> <p data-bbox="548 1509 1421 1625">Different debugging tools work better for different systems and different designers. Early planning can reduce the time spent debugging, and eliminates design changes later to accommodate your preferred debugging methodologies. Adding debug pins may not be enough, because of internal signal and I/O pin accessibility on the device.</p> <p data-bbox="548 1635 1421 1698">For more information about in-system debugging tools in the Quartus II software, refer to the following documents:</p> <ul style="list-style-type: none"> <li data-bbox="548 1709 1201 1740">■ System Debugging Tools Overview in the <i>Quartus II Handbook</i> <li data-bbox="548 1751 1136 1776">■ Virtual JTAG (sld_virtual_jtag) Megafunction User Guide

Table 4. Early Board Design Planning Checklist (Part 3 of 4)

No.	✓ Checklist items
6.	<div data-bbox="505 296 1060 331"> <input type="checkbox"/> <i>Consider the guidelines to plan for debugging tools</i> </div> <ul style="list-style-type: none"> <li data-bbox="548 338 1421 401">■ Select on-chip debugging schemes early to plan memory and logic requirements, I/O pin connections, and board connections. <li data-bbox="548 407 1421 533">■ If you want to use SignalProbe incremental routing, the SignalTap II Embedded Logic Analyzer, Logic Analyzer Interface, In-System Memory Content Editor, In-System Sources and Probes, or Virtual JTAG IP core, plan your system and board with JTAG connections that are available for debugging. <li data-bbox="548 539 1421 602">■ Plan for the small amount of additional logic resources used to implement the JTAG hub logic for JTAG debugging features. <li data-bbox="548 609 1421 672">■ For debugging with the SignalTap II Embedded Logic Analyzer, reserve device memory resources to capture data during system operation. <li data-bbox="548 678 1421 772">■ Reserve I/O pins for debugging with SignalProbe or the Logic Analyzer Interface so that you do not have to change the design or board to accommodate debugging signals later. <li data-bbox="548 779 1421 842">■ Ensure the board supports a debugging mode where debugging signals do not affect system operation. <li data-bbox="548 848 1421 911">■ Incorporate a pin header or micro connector as required for an external logic analyzer or mixed signal oscilloscope. <li data-bbox="548 917 1421 1012">■ To use debug tools incrementally and reduce compilation time, ensure incremental compilation is on so you do not have to recompile the design to modify the debug tool. <li data-bbox="548 1018 1421 1081">■ To use the Virtual JTAG IP core for custom debugging applications, instantiate it in the HDL code as part of the design process. <li data-bbox="548 1087 1421 1150">■ To use the In-System Sources and Probes feature, instantiate the IP core in the HDL code. <li data-bbox="548 1157 1421 1283">■ To use the In-System Memory Content Editor for RAM or ROM blocks or the LPM_CONSTANT IP core, turn on the Allow In-System Memory Content Editor option to capture and update content independently of the system clock option for the memory block in the parameter editor. <p data-bbox="548 1289 1421 1352">For more information about the debugging tools and debugging methods, refer to the following documents:</p> <ul style="list-style-type: none"> <li data-bbox="548 1358 1421 1400">■ <i>Quick Design Debugging Using SignalProbe</i> chapter in the <i>Quartus II Handbook</i> <li data-bbox="548 1407 1421 1467">■ <i>Design Debugging Using the SignalTap II Logic Analyzer</i> chapter in the <i>Quartus II Handbook</i> <li data-bbox="548 1474 1421 1537">■ <i>In-System Debugging Using External Logic Analyzers</i> chapter in the <i>Quartus II Handbook</i> <li data-bbox="548 1543 1421 1606">■ <i>In-System Modification of Memory and Constants</i> chapter in the <i>Quartus II Handbook</i> <li data-bbox="548 1612 1421 1675">■ <i>Design Debugging Using In-System Sources and Probes</i> chapter in the <i>Quartus II Handbook</i> <li data-bbox="548 1682 1421 1724">■ <i>Virtual JTAG (sld_virtual_jtag) Megafunction User Guide</i>

Table 4. Early Board Design Planning Checklist (Part 4 of 4)

No.	✓	Checklist items
7.	<input type="checkbox"/>	<p data-bbox="535 289 1421 352"><i>Use the PowerPlay Early Power Estimator (EPE) to estimate power supplies and cooling solution</i></p> <p data-bbox="535 363 1421 520">FPGA power consumption depends on logic design and is challenging to estimate during early board specification and layout. However, it is an important design consideration and must be estimated accurately to develop an appropriate power budget to design the power supplies, voltage regulators, decoupling capacitors, heat sink, and cooling system.</p> <p data-bbox="535 531 1421 688">Use the Altera PowerPlay EPE spreadsheet to estimate power, current, and device junction temperature before you have a complete design. The EPE calculates the estimated information based on device information, planned device resources, operating frequency, toggle rates, ambient temperature, heat sinks information, air flow, board thermal model, and other environmental considerations.</p> <ul data-bbox="535 699 1421 919" style="list-style-type: none"> <li data-bbox="535 699 1421 783">■ If you have an existing or partially-completed and compiled design—use the Generate PowerPlay Early Power Estimator File command in the Quartus II software to provide input to the EPE spreadsheet. <li data-bbox="535 793 1421 919">■ If you do not have an existing design—estimate manually the number of device resources used in your design and input into the EPE spreadsheet. If the device resources information changes during or after the design phase, your power estimation results will be less accurate. <p data-bbox="535 930 1421 1024">For more information about the EPE user guide and to download the device-specific PowerPlay EPE spreadsheet, refer to the PowerPlay Early Power Estimators (EPE) and Power Analyzer page on the Altera website.</p> <p data-bbox="535 1035 1421 1123">For guidelines about proper power supply design, refer to “Use power distribution network (PDN) tool to plan for power distribution and decoupling capacitor selection” on page 11.</p>

Power Pin Connections

The MAX 10 devices require various voltage supplies depending on your design requirements. Use the following checklist to design the board for the FPGA power pin connections.

Table 5. Power Pin Connections Checklist (Part 1 of 2)

No.	✓ Checklist items
1.	<div data-bbox="503 310 857 342"> <input type="checkbox"/> <i>Design the board for power-up</i> </div> <p data-bbox="548 352 1364 415">The MAX 10 devices support hot socketing (hot plug-in/hot swap) and power sequencing without the use of external devices. Consider the following guidelines:</p> <ul data-bbox="548 426 1421 1470" style="list-style-type: none"> <li data-bbox="548 426 1421 520">■ During power-up, the output buffers are tri-stated and the internal weak pull-up resistors are disabled by default. You can enable the internal weak pull-up resistors through the Quartus II software. <li data-bbox="548 531 1421 594">■ with weak pull-up resistors enabled until the device is configured and configuration pins drive out. <li data-bbox="548 604 1421 819">■ Design the voltage power supply ramps to be monotonic—ensure that the minimum current requirement for the power-on-reset (POR) supplies is available during device power up. The following are the POR monitored power supplies: <ul data-bbox="576 699 974 819" style="list-style-type: none"> <li data-bbox="576 699 974 735">■ V_{CC} or V_{CC_ONE} (after regulated down) <li data-bbox="576 741 974 777">■ V_{CCIO} of bank 1B and bank 8 <li data-bbox="576 783 974 819">■ V_{CCA} <li data-bbox="548 829 1421 945">■ Set the POR delay in the Quartus II software to ensure power supplies are stable. You can extend the POR delay by using an external component to assert the $\overline{nSTATUS}$ pin low. To ensure the device configures properly and enters user mode, extend the POR delay if the board cannot meet the maximum power ramp time specifications. <li data-bbox="548 955 1421 1081">■ Design power sequencing and voltage regulators for the best device reliability—although power sequencing is not required for correct operation, consider the power-up timing of each rail to prevent problems with long-term device reliability if you are designing a multi-rail powered system. <li data-bbox="548 1092 1421 1270">■ Take advantage of the power up sequence for instant-on feature. With instant-on, the device can directly enter user mode with the shortest time after power supplies reach the required level. During power up, the control block reads the POR delay value and instant-on setting bits. If the instant-on is set, the device directly enters the initialization phase. If the instant-on feature is not selected, the POR delay value delays the POR signal. Clear the DSM if you want to change the setting. <li data-bbox="548 1281 1421 1470">■ Connect the GND between boards before connecting the power supplies—Altera uses GND as a reference for hot-socketing operations and I/O buffer designs. Connecting the GND between boards before connecting the power supplies prevents the GND on your board from being pulled up inadvertently by a path to power through other components on your board. A pulled up GND could otherwise cause an out-of-specification I/O voltage or current condition with the device. <p data-bbox="548 1480 1104 1507">For more information, refer to the following documents:</p> <ul data-bbox="548 1518 1128 1633" style="list-style-type: none"> <li data-bbox="548 1518 1128 1549">■ MAX 10 Power Management User Guide <li data-bbox="548 1560 1128 1591">■ MAX 10 FPGA Device Family Pin Connection Guidelines <li data-bbox="548 1602 1128 1633">■ MAX 10 FPGA Configuration User Guide
2.	<div data-bbox="503 1669 1274 1696"> <input type="checkbox"/> <i>Review the list of required supply voltages and the power supply options</i> </div> <p data-bbox="548 1707 1144 1734">MAX 10 devices offer single and dual supply device options.</p> <p data-bbox="548 1745 1396 1801">For a list of the required supply voltages and the recommended operating conditions, refer to the MAX 10 FPGA Device Datasheet.</p>

Table 5. Power Pin Connections Checklist (Part 2 of 2)

No.	✓ Checklist items
3.	<input type="checkbox"/> <i>Ensure I/O power pin compatibility with I/O standards</i> <p>The output pins of the devices will not conform to the I/O standard specifications if the V_{CCIO} level is out of the recommended operating range of the I/O standard.</p> <p>For a complete list of the supported I/O standards and V_{CCIO} voltages, refer to the MAX 10 General Purpose I/O User Guide.</p>
4.	<input type="checkbox"/> <i>Ensure correct power pin connections</i> <ul style="list-style-type: none"> ■ Connect all power pins correctly as specified in the MAX 10 FPGA Device Family Pin Connection Guidelines. ■ Connect V_{CCIO} pins and V_{REF} pins to support the I/O standards of each bank. ■ For unused supplies, consider whether there is a need to ground, open, or retain the power connection.
5.	<input type="checkbox"/> <i>Determine power rail sharing</i> <ul style="list-style-type: none"> ■ Explore unique requirements for FPGA power pins or other power pins on your board, and determine which devices on your board can share a power rail. It is especially important for you to consider the power supply sharing ability of devices from different device families. ■ Follow the suggested power supply sharing and isolation guidance, and the specific guidelines for each pin in the following documents: <ul style="list-style-type: none"> ■ MAX 10 FPGA Device Family Pin Connection Guidelines ■ AN 583: Designing Power Isolation Filters with Ferrite Beads for Altera FPGAs
6.	<input type="checkbox"/> <i>Use power distribution network (PDN) tool to plan for power distribution and decoupling capacitor selection</i> <p>MAX 10 devices include on-die decoupling capacitors to provide high-frequency decoupling.</p> <p>To plan power distribution and return currents from the voltage regulating module to the FPGA power supplies, you can use the PDN design tool that optimizes the board-level PDN graphically. Although you can use SPICE simulation to simulate the circuit, the PDN design tool provides a fast, accurate, and interactive way to determine the right number of decoupling capacitors for optimal cost and performance trade-off.</p> <p>Download the appropriate PDN tool and documentation from the Altera website:</p> <ul style="list-style-type: none"> ■ Power Delivery Network (PDN) Tool ■ AN 574: Printed Circuit Board (PCB) Power Delivery Network (PDN) Design Methodology ■ Device-Specific Power Delivery Network (PDN) Tool User Guide ■ Power Delivery Network (PDN) Tool User Guide (device diagnostic)
7.	<input type="checkbox"/> <i>Review the following guidelines for PLL board design</i> <ul style="list-style-type: none"> ■ Connect all PLL power pins to power supplies to reduce noise even if the design does not use all the PLLs. For pin voltage requirements, refer to the MAX 10 FPGA Device Family Pin Connection Guidelines. ■ Power supply nets should be provided by an isolated power plane, a power plane cut out, or a thick trace.

Configuration Pin Connections

Depending on your configuration scheme, different pull-up or pull-down resistor, signal integrity, and specific pin requirements apply. Connecting the configuration pins correctly is important. Use the following checklist to address common issues.

Table 6. Configuration Pin Connections Checklist (Part 1 of 2)

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Verify configuration pin connections and pull-up or pull-down resistors are correct for your configuration schemes</i></p> <p>For specifics about each configuration pin, refer to the MAX 10 FPGA Device Family Pin Connection Guidelines.</p>
2.	<input type="checkbox"/>	<p><i>Design configuration TCK pin using the same technique as in designing high-speed signal or system clock</i></p> <ul style="list-style-type: none"> Noise on the TCK signal can affect JTAG configuration. For a chain of devices, noise on the TCK pin in the chain can cause JTAG programming or configuration to fail for the entire chain. For a chain of devices, ensure all devices in the JTAG chain are powered on during JTAG programming or configuration.
3.	<input type="checkbox"/>	<p><i>Verify the JTAG pins are connected to a stable voltage level if not in use</i></p> <p>JTAG configuration takes precedence over all configuration methods. If you do not use the JTAG interface, do not leave the JTAG pins floating or toggling during configuration. To disable the JTAG circuitry, connect TCK pin to GND through a 1-kΩ resistor. Connect TMS and TDI pins to V_{CCIO} through a 1-kΩ resistor. Leave TDO unconnected.</p>
4.	<input type="checkbox"/>	<p><i>Verify the JTAG pin connections to the download cable header</i></p> <p>A device operating in JTAG mode uses the required TDI, TDO, TMS, and TCK pins. The TCK pin does not support internal weak pull-down. Connect the TCK pin to an external 1-kΩ to 10-kΩ pull-down resistor. The TDI and TMS pins have weak internal pull-up resistors. The JTAG output pin (TDO) and all JTAG input pins are powered by V_{CCIO}. The voltage range is 1.5 V to 3.3 V.</p> <p>The download cable must be powered at 2.5 V when V_{CCIO} of the JTAG pins are powered at 2.5 V to 3.3 V to prevent voltage overshoot because JTAG pins do not have internal PCI clamping diodes. The TCK pin must be pulled to ground. If the V_{CCIO} of the JTAG pins are powered at 1.5 V or 1.8 V, the download cable should be powered by the same V_{CCIO}.</p>
5.	<input type="checkbox"/>	<p><i>Review the following JTAG pin connections guidelines:</i></p> <ul style="list-style-type: none"> If you have multiple devices in the chain, connect the TDO pin of a device to the TDI pin of the next device in the chain. Noise on the JTAG pins during configuration, user mode, or power-up can cause the device to go into an undefined state or mode. To disable the JTAG state machine during power-up, pull the TCK pin low through a 1-kΩ resistor to ensure that an unexpected rising edge does not occur on TCK. Pull TMS and TDI high through a 1-kΩ to 10-kΩ resistor.

6.	<input type="checkbox"/>	<p><i>Ensure the download cable and JTAG pin voltages are compatible</i></p> <p>The download cable interfaces with the JTAG pins of your device. The operating voltage supplied to the Altera download cable by the target board through the 10-pin header determines the operating voltage level of the download cable. The JTAG pins are powered by V_{CCIO}.</p> <p>In a JTAG chain containing devices with different V_{CCIO} levels, the devices with a higher V_{CCIO} level should drive the devices with the same or lower V_{CCIO} level. A one-level shifter is required at the end of the chain with this device arrangement. If this arrangement is not possible, you have to add more level shifters into the chain.</p> <p>For recommendations about connecting a JTAG chain with multiple voltages across the devices in the chain, refer to the MAX 10 JTAG Boundary-Scan Testing User Guide.</p>
7.	<input type="checkbox"/>	<p><i>Buffer the JTAG signal according to the following guidelines:</i></p> <ul style="list-style-type: none"> ■ If a cable drives three or more devices, buffer the JTAG signal at the cable connector to prevent signal deterioration. ■ Anything added to the board that affects the inductance or capacitance of the JTAG signals increases the likelihood that a buffer should be added to the chain. ■ Each buffer should drive no more than eight loads for the TCK and TMS signals, which drive in parallel. If jumpers or switches are added to the path, decrease the number of loads. <p>For more information about JTAG pin sharing, refer to the MAX 10 JTAG Boundary-Scan Testing User Guide.</p>
8.	<input type="checkbox"/>	<p><i>Ensure all devices in the chain are connected properly</i></p> <p>If your device is in a configuration chain, ensure all devices in the chain are connected properly and powered on.</p>
9.	<input type="checkbox"/>	<p><i>Determine if you need to turn on device-wide output enable</i></p> <p>The MAX 10 device supports an optional chip-wide output enable that allows you to override all tri-states on the device I/Os. When the DEV_OE pin is driven low, all I/O pins are tri-stated; when this pin is driven high, all pins behave as programmed.</p> <p>To use the chip-wide output enable feature:</p> <ul style="list-style-type: none"> ■ Turn on Enable device-wide output enable (DEV_OE) under the General category of the Device and Pin Options dialog box in the Quartus II software before compiling your design ■ Ensure that the DEV_OE pin is driven to a valid logic level on your board ■ Do not leave the DEV_OE pin floating

General I/O Pin Connections

Use the following checklist to plan your general I/O pin connections and to improve signal integrity.

Table 7. General I/O Pin Connections Checklist (Part 1 of 3)

No.	✓ Checklist items
1.	<p><input type="checkbox"/> <i>Specify the state of unused I/O pins according to the following guidelines:</i></p> <ul style="list-style-type: none"> ■ To reduce power dissipation, set clock pins and other unused I/O pins As inputs tri-stated. By default, the Quartus II software set the input pins tri-stated with weak pull-up resistor enabled. ■ To improve signal integrity, in the Reserve all unused pins option under the Unused Pins category of the Device and Pin Options dialog box of the Quartus II software, set the unused pins As output driving ground. This setting reduces inductance by creating a shorter return path and reduces noise on the neighboring I/Os. However, do not use this approach if it results in many via paths that causes congestion for signals under the device. ■ Carefully check the pin connections in the Pin-Out File (.pin) generated by the Quartus II software when you compile your design. The .pin file specifies how you should connect the device pins. I/O pins specified as GND can be left unconnected or connected to ground for improved noise immunity. Do not connect RESERVED pins.
2.	<p><input type="checkbox"/> <i>Refer to the Board Design Resource Center</i></p> <p>If your design has high-speed signals the board design has a major impact on the signal integrity in the system.</p> <p>For detailed information about signal integrity and board design, refer to the Board Design Resource Center on the Altera website.</p> <p>For example, Altera provides the following application notes that offer information about high-speed board stack-up and signal routing layers:</p> <ul style="list-style-type: none"> ■ AN 528: PCB Dielectric Material Selection and Fiber Weave Effect on High-Speed Channel Routing ■ AN 529: Via Optimization Techniques for High-Speed Channel Designs ■ AN 530: Optimizing Impedance Discontinuity Caused by Surface Mount Pads for High-Speed Channel Designs <p>You can also refer to the I/O Management, Board Development Support, and Signal Integrity Analysis Resource Center on the Altera website for board-level signal integrity information related to the Quartus II software.</p>
3.	<p><input type="checkbox"/> <i>Design VREF pins to be noise free</i></p> <p>Voltage deviation on a VREF pin can affect the threshold sensitivity for inputs. For more information about VREF pins and I/O standards, refer to “I/O Features and Pin Connections” on page 17.</p>

Table 7. General I/O Pin Connections Checklist (Part 2 of 3)

No.	✓	Checklist items
4.	<input type="checkbox"/>	<p><i>Refer to the Board Design Guideline Solution Center</i></p> <p>Noise generated by SSN—when too many pins in close proximity change voltage levels at the same time—can reduce the noise margin and cause incorrect switching. For example, consider these board layout recommendations:</p> <ul style="list-style-type: none"> ■ Break out large bus signals on board layers close to the device to reduce cross talk. ■ If possible, route traces orthogonally if two signal layers are next to each other, and use a separation of two to three times the trace width. <p>For more board layout recommendations that can help with noise reduction, refer to the PCB guidelines in the Board Design Guidelines Solution Center on the Altera website.</p> <p>For a list of recommendations for I/O and clock connections, refer to “I/O Simultaneous Switching Noise” on page 25.</p>
5.	<input type="checkbox"/>	<p><i>Verify I/O termination and impedance matching</i></p> <p>Voltage-referenced I/O standards require both a VREF and a termination voltage (V_{TT}). The reference voltage of the receiving device tracks the termination voltage of the transmitting device. Consider the following items:</p> <ul style="list-style-type: none"> ■ Each voltage-referenced I/O standard requires a unique termination setup. For example, a proper resistive signal termination scheme is critical in SSTL-2 standards to produce a reliable DDR memory system with superior noise margin. ■ Although single-ended, non-voltage-referenced I/O standards do not require termination, impedance matching is necessary to reduce reflections and improve signal integrity. ■ Differential I/O standards typically require a termination resistor between the two signals at the receiver. The termination resistor must match the differential load impedance of the signal line. <p>The MAX 10 on-chip series termination provides the convenience of no external components. You can also use external pull-up resistors to terminate the voltage-referenced I/O standards such as SSTL and HSTL.</p> <p>For a complete list of on-chip termination (OCT) support for each I/O standard, refer to the MAX 10 General Purpose I/O User Guide.</p>
6.	<input type="checkbox"/>	<p><i>Perform full board routing simulation using IBIS models</i></p> <p>To ensure that the I/O signaling meets receiver threshold levels on your board setup, perform full board routing simulation with third-party board-level simulation tools using an IBIS model.</p> <p>To select the IBIS output in the Quartus II software, on the Assignments menu, click Settings. Navigate to the Board-Level page of the EDA Tool Settings category. Under the Board-level signal integrity analysis section, in the Format option, select IBIS.</p> <p>For more information, refer to the Signal Integrity Analysis with Third-Party Tools chapter of the <i>Quartus II Handbook</i>.</p>

Table 7. General I/O Pin Connections Checklist (Part 3 of 3)

7.	<div data-bbox="503 289 1421 325"> <input type="checkbox"/> <i>Configure board trace models for Quartus II advanced timing analysis</i> </div> <p>In order for a system to operate properly, signal integrity and board routing propagation delays must be taken into consideration. If you use an FPGA with high-speed interfaces in your board design, analyze the board level timing as part of the I/O and board planning.</p> <p>Differential I/Os at the top left corner are located in the low speed region. For more information about the performance of these I/O pins, refer to the following documents:</p> <ul style="list-style-type: none"> ■ Device pin-outs for MAX 10 devices in the Device Pin-Outs page ■ MAX 10 FPGA Device Datasheet <p>To generate a more accurate I/O delays and extra reports to gain better insights into the signal behavior at the system level, turn on Enable Advanced I/O Timing under the TimeQuest Timing Analyzer category in the Settings dialog box of your Quartus II project. With this option turned on, the TimeQuest Timing Analyzer uses simulation results for the I/O buffer, package, and board trace model to generate the I/O delays.</p> <p>You can use the advanced timing reports as a guide to make changes to the I/O assignments and board design to improve timing and signal integrity.</p>
8.	<div data-bbox="503 871 1421 907"> <input type="checkbox"/> <i>Review your pin connections</i> </div> <p>Altera provides schematic review worksheets based on the device Pin Connection Guidelines and other board-level pin connections literature that you need to consider when you finalize your schematics.</p> <p>Use the MAX 10 Device Schematic Review Worksheet to help you find mistakes in your schematic and adhere to Altera's guidelines:</p>

I/O and Clock Planning

Use the checklists in this section as guidelines to plan your I/O and clocking.

Early Pin Planning and I/O Assignment Analysis

In many design environments, FPGA designers want to plan top-level FPGA I/O pins early so that board designers can start developing the PCB design and layout.

Table 8. Early Pin Planning and I/O Assignment Analysis Checklist (Part 1 of 2)

No.	✓ Checklist items
1.	<div data-bbox="503 1541 1421 1577"> <input type="checkbox"/> <i>Verify pin locations early in the FPGA place-and-route software</i> </div> <p>The FPGA I/O capabilities and board layout guidelines influence pin locations and other types of assignments. Starting FPGA pin planning early improves the confidence in early board layouts, reduces the chance of error, and improves the overall time-to-market.</p>

I/O Features and Pin Connections

Use the checklist in this section for guidelines related to I/O features, I/O signal types, I/O standards, I/O banks memory interfaces, pad placements, and special pin connections.

For a list of I/O pin locations and connection guidelines, refer to the *MAX 10 FPGA Device Family Pin Connection Guidelines*.

 To obtain device pin-outs for MAX 10 devices, refer to the [Device Pin-Outs](#) page of the Literature section of the Altera website (www.altera.com).

Table 9. I/O Features and Pin Connections Checklist (Part 1 of 6)

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Determine if your system requires single-ended I/O signaling</i></p> <ul style="list-style-type: none"> ■ Single-ended I/O signaling provides a simple rail-to-rail interface. ■ The speed is limited by the large voltage swing and noise. ■ Single-ended I/Os do not require termination, unless reflection in the system causes undesirable effects. <p>For more information about the I/O restrictions guidelines, refer to the Design Considerations chapter in the MAX 10 General Purpose I/O User Guide.</p>
2.	<input type="checkbox"/>	<p><i>Determine if your system requires voltage-referenced signaling</i></p> <ul style="list-style-type: none"> ■ Voltage-referenced signaling reduces the effects of simultaneous switching outputs (SSO) from pins changing voltage levels at the same time (for example, external memory interface data and address buses). ■ Voltage-referenced signaling provides an improved logic transition rate with a reduced voltage swing, and minimizes noise caused by reflection with a termination requirement. ■ Additional termination components are required for the reference voltage source (V_{TT}). <p>For more information about the VREF restrictions guidelines, refer to the Design Considerations chapter in the MAX 10 General Purpose I/O User Guide.</p>
3.	<input type="checkbox"/>	<p><i>Determine if your system requires differential signaling</i></p> <ul style="list-style-type: none"> ■ Differential signaling eliminates the interface performance barrier of single-ended and voltage-referenced signaling, with superior speed using an additional inverted closely-coupled data pair. ■ Differential signaling avoids the requirement for a clean reference voltage. This is possible because of lower swing voltage and noise immunity with a common mode noise rejection capability. ■ Considerations for this implementation include the requirements for a dedicated PLL to generate a sampling clock, and matched trace lengths to eliminate the phase difference between an inverted and non-inverted pair. ■ Allow the software to assign locations for the negative pin in differential pin pairs. You only need to assign the positive pins. <p>For more information about the differential I/O restrictions guidelines, refer to the Design Considerations chapter in the MAX 10 General Purpose I/O User Guide.</p>
4.	<input type="checkbox"/>	<p><i>Select a suitable signaling type and I/O standard for each I/O pin</i></p> <p>Ensure that the appropriate I/O standard support is supported in the targeted I/O bank.</p> <p>For more information, refer to the following documents:</p> <ul style="list-style-type: none"> ■ MAX 10 General Purpose I/O User Guide ■ MAX 10 High-Speed LVDS I/O User Guide

Table 9. I/O Features and Pin Connections Checklist (Part 2 of 6)

No.	✓ Checklist items
5.	<input type="checkbox"/> <i>Place I/O pins that share voltage levels in the same I/O bank</i> <ul style="list-style-type: none"> ■ Certain I/O banks can support different I/O standards and voltage levels. ■ You can assign I/O standards and make other I/O-related settings in the Pin Planner. ■ Use the correct dedicated pin inputs for signals such as clocks and global control signals.
6.	<input type="checkbox"/> <i>Verify that all output signals in each I/O bank are intended to drive out at the bank's assigned VCCIO voltage level</i> <ul style="list-style-type: none"> ■ The board must supply each bank with one V_{CCIO} voltage level for every V_{CCIO} pin in a bank. ■ Each I/O bank is powered by the V_{CCIO} pins of that particular bank and is independent of the V_{CCIO} of other I/O banks. ■ A single I/O bank supports output signals that are driving at the same voltage as the V_{CCIO}. ■ An I/O bank can simultaneously support any number of input signals with different I/O standards. <p>For more information, refer to the I/O Standard Support section in the <i>MAX 10 General Purpose I/O User Guide</i>.</p>
7.	<input type="checkbox"/> <i>Verify that all voltage-referenced signals in each I/O bank are intended to use the bank's VREF voltage (for devices that support VREF pins)</i> <ul style="list-style-type: none"> ■ To accommodate voltage-referenced I/O standards, each I/O bank supports multiple VREF pins feeding a common VREF bus. Set the VREF pins to the correct voltage for the I/O standards in the bank. ■ Each I/O bank can only have a single V_{CCIO} voltage level and a single VREF voltage level at a given time. If the VREF pins are not used as voltage references, the pins cannot be used as generic I/O pins and must be tied to the V_{CCIO} of that same bank or GND. ■ An I/O bank, including single-ended or differential standards, can support voltage-referenced standards as long as all voltage-referenced standards use the same VREF setting. ■ For performance reasons, voltage-referenced input standards use their own V_{CCIO} level as the power source. You can place voltage-referenced input signals in a bank with a V_{CCIO} of 2.5 V or below. ■ Voltage-referenced bidirectional and output signals must drive out at the V_{CCIO} voltage level of the I/O bank.
8.	<input type="checkbox"/> <i>Check the I/O bank support for LVDS features</i> <p>Different I/O banks include different support for LVDS signaling. Some banks have lower speed performance. Allocate the pins according to your data rate requirement.</p> <p>For more information, refer to the <i>MAX 10 High-Speed LVDS I/O User Guide</i>.</p>
9.	<input type="checkbox"/> <i>Verify the usage of the VREF pins that are used as regular I/Os</i> <p>VREF pins have higher pin capacitance that results in a different I/O timing:</p> <ul style="list-style-type: none"> ■ Do not use these pins in a grouped interface such as a bus. ■ Do not use these pins for high edge rate signals such as clocks.

Table 9. I/O Features and Pin Connections Checklist (Part 3 of 6)

No.	✓	Checklist items
10.	<input type="checkbox"/>	<p><i>Test pin connections with boundary-scan test</i></p> <p>A boundary-scan test allows you to test pin connections at board level without using physical test probes while the device is operating normally. To perform the boundary-scan test, you must have the boundary-scan description language (BSDL) file of the device.</p> <p>Use the BSDL files from the Altera website to perform boundary-scan test on pre-configured MAX 10 devices. For post-configured devices, you must modify the BSDL file according to the design.</p> <p>To perform boundary-scan test after configuration, BSDL generation tool, and guidelines, refer to the Altera BSDL Support website.</p>
11.	<input type="checkbox"/>	<p><i>Use the UniPHY IP core for each memory interface, and follow connection guidelines</i></p> <p>The self-calibrating UniPHY IP core is optimized to take advantage of the MAX 10 structure. The UniPHY IP core allows you to set external memory interface features and helps set up the physical interface (PHY) best suited for your system. When you use the Altera memory controller IP core functions, the UniPHY IP core is instantiated automatically.</p> <p>If you design multiple memory interfaces into the device using Altera IP, generate a unique interface for each instance to ensure good results instead of designing it once and instantiating it multiple times.</p> <p>For more information, refer to the Planning Pin and FPGA Resources chapter in the <i>External Memory Interface Handbook</i>.</p>
12.	<input type="checkbox"/>	<p><i>Use dedicated DQ/DQS pins and DQ groups for memory interfaces</i></p> <p>The data strobe DQS and data DQ pin locations are fixed in MAX 10 devices. Before you design your device pin-out, refer to the memory interface guidelines for details and important restrictions related to the connections for these and other memory related signals.</p> <p>For more information about specific external memory interface topic, refer to the following documents:</p> <ul style="list-style-type: none"> ■ MAX 10 External Memory Interface User Guide ■ Volume 2: Design Guidelines in the <i>External Memory Interface Handbook</i> ■ External Memory Interface Spec Estimator on the Altera website ■ External Memory Solutions Center on the Altera website

Clock Planning

The first stage in planning your clocking scheme is to determine your system clock requirements:

- Understand your device's available clock resources and correspondingly plan the design clocking scheme. Consider your requirements for timing performance, and how much logic is driven by a particular clock.
- Based on your system requirements, define the required clock frequencies for your FPGA design and the input frequencies available to the FPGA. Use these specifications to determine your PLL scheme.

- Use the Quartus II parameter editor to enter your settings in ALTPLL IP core, and check the results to verify whether particular features and input/output frequencies can be implemented in a particular PLL.

Table 10. Clock Planning Checklist

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Use the device PLLs for clock management</i></p> <p>Connect clock inputs to specific PLLs to drive specific low-skew routing networks. Analyze the global resource availability for each PLL and the PLL availability for each clock input pin. Use the following descriptions for the clock signals in your design:</p> <ul style="list-style-type: none"> ■ The GCLK networks can drive throughout the entire device, serving as low-skew clock sources for device logic. ■ IOEs and internal logic can also drive GCLKs to create internally generated GCLKs and other high fan-out control signals; for example, synchronous or asynchronous clears and clock enables. ■ PLLs cannot be driven by internally-generated GCLKs. The input clock to the PLL must come from dedicated clock input pins or from another pin/PLL-fed GCLK.
2.	<input type="checkbox"/>	<p><i>Ensure that you select the correct PLL feedback compensation mode</i></p> <p>MAX 10 PLLs support four different clock feedback modes. For more information, refer to the “Clock Feedback Modes” section in the MAX 10 Clocking and PLL User Guide.</p>
3.	<input type="checkbox"/>	<p><i>Check that the PLL offers the required number of clock outputs and use dedicated clock output pins</i></p> <p>You can connect clock outputs to dedicated clock output pins or clock networks. MAX 10 PLL only allows one clock output per PLL block. If your device have 4 PLLs, there are 4 clock outputs from the PLLs.</p>
4.	<input type="checkbox"/>	<p><i>Use the clock control block for clock selection and power-down</i></p> <p>Every GCLK network has its own clock control block. The control block provides the following features that you can use to select different clock input signals or power-down clock networks to reduce power consumption without using any combinational logic in your design:</p> <ul style="list-style-type: none"> ■ Clock source selection (with dynamic selection) ■ GCLK multiplexing ■ Clock power down (with static or dynamic clock enable or disable) <p>In MAX 10 devices, the <code>clkena</code> signals are supported at the clock network level instead of at the PLL output counter level. This allows you to gate off the clock even when you are not using a PLL. You can also use the <code>clkena</code> signals to control the dedicated external clocks from the PLLs.</p> <p>For more information, refer to the MAX 10 Clocking and PLL User Guide.</p>
5.	<input type="checkbox"/>	<p><i>Instantiate PLL with ADC</i></p> <p>You can only use the PLL <code>c0</code> counter to connect to the ADC reference clock pin.</p>

I/O Simultaneous Switching Noise

SSN is a concern when too many I/Os (in close proximity) change voltage levels at the same time. Use the checklist in this section for recommendations to plan I/O and clock connections.

Table 11. I/O Simultaneous Switching Noise Checklist

No.	✓ Checklist item
1.	<div data-bbox="505 485 1421 512"> <input type="checkbox"/> <i>Consider the following recommendations to mitigate I/O simultaneous switching noise:</i> </div> <ul style="list-style-type: none"> ■ Analyze the design for possible SSN problems. ■ Reduce the number of pins that switch the voltage level at exactly the same time whenever possible. ■ Use differential I/O standards and lower-voltage standards for high-switching I/Os. ■ Use lower drive strengths for high-switching I/Os. The default drive strength setting might be higher than your design requires. ■ Reduce the number of simultaneously switching output pins within each bank. Spread output pins across multiple banks if possible. ■ Spread the switching I/Os evenly throughout the bank to reduce the number of aggressors in a given area to reduce SSN if bank usage is substantially below 100%. ■ Separate simultaneously switching pins from input pins that are susceptible to SSN. ■ Place important clock and asynchronous control signals near ground signals and away from large switching buses. ■ Avoid using I/O pins one or two pins away from PLL power supply pins for high-switching or high-drive strength pins. ■ Use staggered output delays to shift the output signals through time, or use adjustable slew rate settings. <p>For information and guidelines on using available I/O features, refer to “I/O Features and Pin Connections” on page 17.</p> <p>For signal integrity design techniques to mitigate SSN, view the Signal & Power Integrity Design Techniques for SSN webcast on the Altera website.</p>
2.	<div data-bbox="505 1310 1421 1337"> <input type="checkbox"/> <i>Check on the pin connection guidelines for the ADC pins</i> </div> <p>For more information about the filter type requirement at the ADC power pin, analog input pins, and VREF pin, refer to the MAX 10 FPGA Device Family Pin Connection Guidelines.</p>

Design Entry

In complex FPGA design development, design practices, coding styles, and IP core usage have an enormous impact on your device's timing performance, logic utilization, and system reliability. In addition, while planning and creating the design, plan for a hierarchical or team-based design to improve design productivity.

Table 12. Design Entry Checklist (Part 1 of 5)

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Use synchronous design practices</i></p> <p>In a synchronous design, a clock signal triggers all events. When all of the registers' timing requirements are met, a synchronous design behaves in a predictable and reliable manner for all process, voltage, and temperature (PVT) conditions. You can easily target synchronous designs to different device families or speed grades.</p>
2.	<input type="checkbox"/>	<p><i>Consider the following recommendations to avoid clock signals problems:</i></p> <ul style="list-style-type: none"> ■ Use dedicated clock pins and clock routing for best results—dedicated clock pins drive the clock network directly, ensuring lower skew than other I/O pins. Use the dedicated routing network to have a predictable delay with less skew for high fan-out signals. You can also use the clock pins and clock network to drive control signals like asynchronous reset. ■ For clock inversion, multiplication, and division use the device PLLs. ■ For clock multiplexing and gating, use the dedicated clock control block or PLL clock switchover feature instead of combinational logic. ■ If you must use internally generated clock signals, register the output of any combinational logic used as a clock signal to reduce glitches. For example, if you divide a clock using combinational logic, clock the final stage with the clock signal that was used to clock the divider circuit. ■ In multi-clock designs, ensure that signals crossing clock domains are properly synchronized using the synchronizer, a handshake mechanism, or a FIFO. <p>For more information about clock networks, refer to the MAX 10 Clocking and PLL User Guide.</p>
3.	<input type="checkbox"/>	<p><i>Use IP cores with the parameter editor</i></p> <p>Instead of coding your own logic, save your design time by using Altera's IP cores—a library of parameterized modules and device-specific IP cores. The IP cores are optimized for Altera device architectures and can offer more efficient logic synthesis and device implementation.</p> <p>To ensure that you set all ports and parameters correctly, use the Quartus II parameter editor to build or change IP cores parameters.</p> <p>For detailed information about a specific IP core, refer to the respective MAX 10 user guides.</p>
4.	<input type="checkbox"/>	<p><i>Review the information on dynamic reconfiguration feature</i></p> <p>The MAX 10 devices support dynamic reconfiguration—dynamically change the PMA settings or protocols of a channel affecting data transfer on adjacent channels.</p>

Table 12. Design Entry Checklist (Part 2 of 5)

No.	✓ Checklist items
5.	<p><input type="checkbox"/> <i>Consider the Altera's recommended coding styles to achieve optimal synthesis results</i></p> <p>HDL coding styles can have a significant impact on the quality of results for programmable logic designs. For example, when designing memory and digital system processing (DSP) functions, understanding the device architecture helps you to take advantage of the dedicated logic block sizes and configurations.</p> <ul style="list-style-type: none"> ■ For specific HDL coding examples and recommendations, refer to the <i>Recommended HDL Coding Styles</i> chapter in the <i>Quartus II Handbook</i>. ■ You can use the HDL templates provided in the Quartus II software as examples for your reference. To access the templates, right click the editing area in the Quartus II text editor and click Insert Template. ■ For additional tool-specific guidelines, refer to the documentation of your synthesis tool.
6.	<p><input type="checkbox"/> <i>Enable the chip-wide reset to clear all registers if required</i></p> <p>MAX 10 devices support an optional chip-wide reset that enables you to override all clears on all device registers, including the registers of the memory blocks (but not the memory contents).</p> <ul style="list-style-type: none"> ■ DEV_CLRn pin is driven low—all registers are cleared or reset to 0. The affected register behave as if they are preset to a high value when synthesis performs an optimization called NOT-gate-push back due to register control signals. ■ DEV_CLRn pin is driven high—all registers behave as programmed. <p>To enable chip-wide reset, before compiling your design, turn on Enable device-wide reset (DEV_CLRn) under the Options list of the General category in the Device and Pin Options dialog box of the Quartus II software.</p>
7.	<p><input type="checkbox"/> <i>Use device architecture-specific register control signals</i></p> <p>Each MAX 10 logic array block (LAB) contains dedicated logic for driving register control signals to its ALMs. It is important that the control signals use the dedicated control signals in the device architecture. In some cases, you may be required to limit the number of different control signals in your design.</p> <p>For more information about LAB and ALM architecture, refer to the <i>MAX 10 FPGA Device Architecture</i>.</p>
8.	<p><input type="checkbox"/> <i>Review recommended reset architecture</i></p> <ul style="list-style-type: none"> ■ If the clock signal is not available when reset is asserted, an asynchronous reset is typically used to reset the logic. ■ The recommended reset architecture allows the reset signal to be asserted asynchronously and deasserted synchronously. ■ The source of the reset signal is connected to the asynchronous port of the registers, which can be directly connected to global routing resources. ■ The synchronous deassertion allows all state machines and registers to start at the same time. ■ Synchronous deassertion avoids an asynchronous reset signal from being released at, or near, the active clock edge of a flipflop that can cause the output of the flipflop to go to a metastable unknown state. <p>For more information about good reset design, refer to industry papers such as the analysis of reset architecture at www.sunburst-design.com/papers.</p>

Table 12. Design Entry Checklist (Part 3 of 5)

No.	✓ Checklist items
9.	<div data-bbox="505 296 529 327"><input type="checkbox"/></div> <div data-bbox="553 296 1154 327"><i>Review the synthesis options available in your synthesis tool</i></div> <p data-bbox="553 338 1406 396">If you force a particular power-up condition for your design, use the synthesis options available in your synthesis tool:</p> <ul data-bbox="553 407 1421 1020" style="list-style-type: none"> <li data-bbox="553 407 1421 499">■ By default, the Quartus II software Integrated Synthesis turns on the Power-Up Don't Care logic option that assumes your design does not depend on the power-up state of the device architecture. Other synthesis tools might use similar assumptions. <li data-bbox="553 510 1421 632">■ Designers typically use an explicit reset signal for the design that forces all registers into their appropriate values after reset but not necessarily at power-up. You can create your design with asynchronous reset that allows you to power up the design safely with the reset active, regardless of the power-up conditions of the device. <li data-bbox="553 642 1421 793">■ Some synthesis tools can also read the default or initial values for registered signals in your source code and implement the behavior in the device. For example, the Quartus II software Integrated Synthesis converts HDL default and initial values for registered signals into Power-Up Level settings. The synthesized behavior matches the power-up conditions of the HDL code during a functional simulation. <li data-bbox="553 804 1421 1020">■ Registers in the device core always power up to a low (0) logic level in the physical device architecture. If you specify a high power-up level or a non-zero reset value (preset signal), synthesis tools typically use the clear signals available on the registers and perform the NOT-gate push back optimization technique. If you assign a high power-up level to a register that is reset low, or assign a low power-up value to a register that is preset high, synthesis tools cannot use the NOT-gate push back optimization technique and might ignore the power-up conditions. <p data-bbox="553 1031 1406 1123">For more information about the Power-Up Level settings and the <code>altera_attribute</code> assignment that sets the power-up state, refer to the <i>Quartus II Integrated Synthesis</i> chapter of the <i>Quartus II Handbook</i>.</p>
10.	<div data-bbox="505 1152 529 1184"><input type="checkbox"/></div> <div data-bbox="553 1152 1247 1184"><i>Consider resources available for register power-up and control signals</i></div> <p data-bbox="553 1194 1421 1316">To implement a reset and preset signal on the same register, synthesis tools emulate the controls with logic and latches that can be prone to glitches because of the different delays between the different paths to the register. In addition, the power-up value is undefined for these registers.</p> <p data-bbox="553 1327 1308 1383">For more information about reset logic and power up conditions, refer to the <i>Recommended HDL Coding Styles</i> chapter in the <i>Quartus II Handbook</i>.</p>

Table 12. Design Entry Checklist (Part 4 of 5)

No.	✓	Checklist items
11.	<input type="checkbox"/>	<p data-bbox="560 289 1421 331"><i>Consider Altera's recommendations for creating design partitions</i></p> <p data-bbox="560 331 1421 430">Partitioning a design for an FPGA requires planning to ensure optimal results when the partitions are integrated and ensures that each partition is well placed, relative to other partitions in the device.</p> <p data-bbox="560 430 1421 598">Follow Altera's recommendations for creating design partitions to improve the overall quality of results. For example, registering partition I/O boundaries keeps critical timing paths inside one partition that can be optimized independently. Plan your source code so that each design block is defined in a separate file. The software can automatically detect changes to each block separately.</p> <p data-bbox="560 598 1421 703">Use hierarchy in your design to provide more flexibility when partitioning. Keep your design logic in the leaves of the hierarchy trees; that is, the top level of the hierarchy should have very little logic, and the lower-level design blocks contain the logic.</p> <p data-bbox="560 703 1421 808">For guidelines to help you create design partitions, refer to the <i>Best Practices for Incremental Compilation Partitions and Floorplan Assignments</i> chapter in the <i>Quartus II Handbook</i>.</p>
12.	<input type="checkbox"/>	<p data-bbox="560 829 1421 871"><i>Perform timing budgeting and resource balancing between partitions</i></p> <p data-bbox="560 871 1421 955">If your design is created in multiple projects, it is important that the system architect provide guidance to designers of lower-level blocks to ensure that each partition uses the appropriate device resources:</p> <ul data-bbox="560 955 1421 1291" style="list-style-type: none"> <li data-bbox="560 955 1421 1060">■ Because the designs are developed independently, each lower-level designer has no information about the overall design or how their partition connects with other partitions, which can lead to problems during system integration. <li data-bbox="560 1060 1421 1165">■ The top-level project information, including pin locations, physical constraints, and timing requirements, should be communicated to the designers of lower-level partitions before they start their design. <li data-bbox="560 1165 1421 1291">■ The system architect can plan design partitions at the top level and use the Quartus II software Generate Bottom-Up Design Partition Scripts option on the Project menu to automate the process of transferring top-level project information to lower-level modules.

Table 12. Design Entry Checklist (Part 5 of 5)

No.	✓ Checklist items
13.	<div data-bbox="505 296 1179 327"> <input type="checkbox"/> <i>Create a design floorplan for incremental compilation partitions</i> </div> <ul style="list-style-type: none"> <li data-bbox="548 338 1425 432">■ A design floorplan avoids conflicts between design partitions and ensure that each partition is well-placed relative to other partitions. When you create different location assignments for each partition, no location conflicts occur. <li data-bbox="548 443 1425 537">■ A design floorplan helps avoid situations in which the Fitter is directed to place or replace a portion of the design in an area of the device where most resources have already been claimed. <li data-bbox="548 548 1425 642">■ Floorplan assignments are recommended for timing-critical partitions in top-down flows. You can use the Quartus II Chip Planner to create a design floorplan using LogicLock region assignments for each design partition. <li data-bbox="548 653 1425 747">■ With a basic design framework for the top-level design, the floorplan editor enables you to view connections between regions, estimate physical timing delays on the chip, and move regions around the device floorplan. <li data-bbox="548 758 1425 821">■ After you compiled the full design, you can also view logic placement and locate areas of routing congestion to improve the floorplan assignments. <p data-bbox="548 831 1425 884">For more information and guidelines in creating a design floorplan and placement assignments in the floorplan, refer to the following chapters in the <i>Quartus II Handbook</i>:</p> <ul style="list-style-type: none"> <li data-bbox="548 894 1382 926">■ <i>Best Practices for Incremental Compilation Partitions and Floorplan Assignments</i> <li data-bbox="548 936 1260 968">■ <i>Analyzing and Optimizing the Design Floorplan with the Chip Planner</i>

Design Implementation

Use the checklists in the this section as guidelines while implementing your design.

Synthesis and Compilation

Table 13. Synthesis and Compilation Checklist (Part 1 of 3)

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p data-bbox="535 493 1421 535"><i>Specify your synthesis tool and use correct supported version</i></p> <p data-bbox="535 535 1421 703">The Quartus II software includes integrated synthesis that fully supports Verilog HDL, VHDL, Altera hardware description language (AHDL), and schematic design entry. You can also use industry-leading third-party EDA synthesis tools to synthesize your Verilog HDL or VHDL design, and then compile the resulting output netlist file in the Quartus II software:</p> <ul data-bbox="535 703 1421 1207" style="list-style-type: none"> <li data-bbox="535 703 1421 808">■ Specify a third-party synthesis tool in the New Project Wizard or the EDA Tools Settings page of the Settings dialog box to use the correct Library Mapping File (.lmf) for your synthesis netlist. <li data-bbox="535 808 1421 913">■ Altera recommends that you use the most recent version of third-party synthesis tools because tool vendors are continuously adding new features, fixing tool issues, and enhancing performance for Altera devices. <li data-bbox="535 913 1421 1018">■ Different synthesis tools can give different results. If you want to select the best-performing tool for your application, you can experiment by synthesizing typical designs for your application and coding style, and comparing the results. <li data-bbox="535 1018 1421 1081">■ Perform placement and routing in the Quartus II software to get accurate timing analysis and logic utilization results. <li data-bbox="535 1081 1421 1207">■ Your synthesis tool may offer the capability to create a Quartus II project and pass constraints such as the EDA tool setting, device selection, and timing requirements that you specified in your synthesis project. You can use this capability to save time when setting up your Quartus II project for placement and routing. <p data-bbox="535 1207 1421 1291">For more information about supported synthesis tools, refer to the following chapters of the Quartus II Handbook:</p> <ul data-bbox="535 1291 1421 1459" style="list-style-type: none"> <li data-bbox="535 1291 1421 1333">■ <i>Quartus II Integrated Synthesis</i> <li data-bbox="535 1333 1421 1375">■ <i>Synopsys Synplify Support</i> <li data-bbox="535 1375 1421 1417">■ <i>Mentor Graphics Precision Synthesis Support</i> <li data-bbox="535 1417 1421 1459">■ <i>Mentor Graphics LeonardoSpectrum Support</i> <p data-bbox="535 1459 1421 1543">For information about the officially supported version of each synthesis tool in a Quartus II software version, refer to the relevant Quartus II software release notes on the Release Notes page at the Altera website.</p>

Table 13. Synthesis and Compilation Checklist (Part 2 of 3)

No.	✓ Checklist items
2.	<p data-bbox="503 300 1068 325"><input type="checkbox"/> <i>Review resource utilization reports after compilation</i></p> <p data-bbox="548 338 1356 396">After compilation in the Quartus II software, review the device resource utilization information:</p> <ul data-bbox="548 409 1421 835" style="list-style-type: none"> <li data-bbox="548 409 1421 468">■ Use the information to determine whether the future addition of extra logic or other design changes introduce fitting difficulties. <li data-bbox="548 480 1421 539">■ If your compilation results in a no-fit error, use the information to analyze fitting problems. <li data-bbox="548 552 1421 674">■ To determine resource usage, refer to the Flow Summary section of the Compilation Report for a percentage representing the total logic utilization, which includes an estimation of resources that cannot be used due to existing connections or logic usage. <li data-bbox="548 686 1421 835">■ For more detailed resource information, view the reports under Resource Section in the Fitter section of the Compilation Report. The Fitter Resource Usage Summary report breaks down the logic utilization information and indicates the number of fully and partially used ALMs, and provides other resource information including the number of bits in each type of memory block. <p data-bbox="548 848 1421 1031">There are also reports that describe some of the optimizations that occurred during compilation. For example, if you use the Quartus II Integrated Synthesis, the reports under the Optimization Results folder in the Analysis & Synthesis section provide information that includes registers that were removed during synthesis. Use this report to estimate device resource utilization for a partial design to ensure that registers were not removed due to missing connections with other parts of the design.</p> <p data-bbox="548 1043 1421 1228">Low logic utilization does not mean the lowest possible ALM utilization. A design that is reported to be close to 100% may still have space for extra logic. The Fitter uses ALUTs in different ALMs, even when the logic can be placed within one ALM, so that it can achieve the best timing and routability results. Logic might be spread throughout the device when achieving these results. As the device fills up, the Fitter automatically searches for logic that can be placed together in one ALM.</p>
3.	<p data-bbox="503 1249 1247 1285"><input type="checkbox"/> <i>Review all Quartus II messages, especially warning or error messages</i></p> <p data-bbox="548 1297 1421 1383">Each stage of the compilation flow generates messages, including informational notes, warnings, and critical warnings. Understand the significance of warning messages and make changes to the design or settings if required.</p> <p data-bbox="548 1396 1421 1482">In the Quartus II user interface, you can use the Message window tabs to look at only certain types of messages. You can suppress the messages if you have determined that your action is not required.</p> <p data-bbox="548 1495 1421 1556">For more information about messages and message suppression, refer to the <i>Managing Quartus II Projects</i> chapter in the <i>Quartus II Handbook</i>.</p>
4.	<p data-bbox="503 1577 946 1612"><input type="checkbox"/> <i>Consider using incremental compilation</i></p> <p data-bbox="548 1625 1421 1757">Use the incremental compilation feature to preserve logic in unchanged parts of your design, preserve timing performance, and reach timing closure more efficiently. You can speed up design iteration time by an average of 60% when making changes to the design with the incremental compilation feature.</p>

Table 13. Synthesis and Compilation Checklist (Part 3 of 3)

No.	✓	Checklist items
5.	<input type="checkbox"/>	<p><i>Ensure parallel compilation is enabled</i></p> <p>The Quartus II software can run some algorithms in parallel to take advantage of multiple processors and reduce compilation time when more than one processor is available to compile the design. Set the Parallel compilation option on the Compilation Process Settings page of the Settings dialog box, or change the default setting in the Options dialog box in the Processing page from the Tools menu.</p>
6.	<input type="checkbox"/>	<p><i>Use the Compilation Time Advisor</i></p> <p>The Compilation Time Advisor provides guidance in making settings that reduce your design compilation time. On the Tools menu, point to Advisors and click Compilation Time Advisor. Using some of these techniques to reduce compilation time can reduce the overall quality of results.</p> <p>For more information, refer to the <i>Timing Closure and Optimization</i> chapter in the Quartus II Handbook.</p>

Timing Optimization and Analysis

Use the guidelines in the following checklist for analyzing your design timing and optimizing your timing performance.

Table 14. Timing Optimization and Analysis Checklist (Part 1 of 2)

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Ensure timing constraints are complete and accurate</i></p> <p>In an FPGA design flow, accurate timing constraints allow timing-driven synthesis software and place-and-route software to obtain optimal results. Timing constraints are critical to ensure designs meet their timing requirements, which represent actual design requirements that must be met for the device to operate correctly.</p> <p>The Quartus II software optimizes and analyzes your design using different timing models for each device speed grade, so you must perform timing analysis for the correct speed grade. The final programmed device might not operate as expected if the timing paths are not fully constrained, analyzed, and verified to meet requirements.</p> <p>For more information, refer to the <i>Timing Analysis Overview</i> chapter of the <i>Quartus II Handbook</i>.</p>
2.	<input type="checkbox"/>	<p><i>Review the TimeQuest Timing Analyzer reports after compilation</i></p> <p>The Quartus II software includes the Quartus II TimeQuest Timing Analyzer, a powerful ASIC-style timing analysis tool that validates the timing performance of all logic in your design. It supports the industry standard Synopsys Design Constraints (SDC) format timing constraints, and has an easy-to-use GUI with interactive timing reports. It is ideal for constraining high-speed source-synchronous interfaces and clock multiplexing design structures.</p> <p>The software also supports static timing analysis in the industry-standard Synopsys Primetime software. To generate the required timing netlist, specify the tool in the New Project Wizard or the EDA Tools Settings page of the Settings dialog box.</p>

Table 14. Timing Optimization and Analysis Checklist (Part 2 of 2)

No.	✓ Checklist items
3.	<p data-bbox="503 296 1323 327"><input type="checkbox"/> <i>Ensure that the I/O timings are not violated when data is provided to the FPGA</i></p> <p data-bbox="548 338 1425 432">A comprehensive static timing analysis includes analysis of register to register, I/O, and asynchronous reset paths. It is important to specify the frequencies and relationships for all clocks in your design.</p> <p data-bbox="548 443 1425 537">Use input and output delay constraints to specify external device or board timing parameters. Specify accurate timing requirements for external interfacing components to reflect the exact system intent.</p> <p data-bbox="548 548 1425 730">The TimeQuest Timing Analyzer performs static timing analysis on the entire system, using data required times, data arrival times, and clock arrival times to verify circuit performance and detect possible timing violations. It determines the timing relationships that must be met for the design to correctly function. You can use the <code>report_datasheet</code> command to generate a datasheet report that summarizes the I/O timing characteristics of the entire design.</p>
4.	<p data-bbox="503 751 1201 783"><input type="checkbox"/> <i>Perform Early Timing Estimation before running a full compilation</i></p> <p data-bbox="548 793 1425 919">If the timing analysis reports that your design requirements were not met, you must make changes to your design or settings and recompile the design to achieve timing closure. If your compilation results in no-fit messages, you must make changes to get successful placement and routing.</p> <p data-bbox="548 930 1425 1056">You can use the Early Timing Estimation feature in the Quartus II software to estimate your design's timing results before the software performs full placement and routing. On the Processing menu, point to Start and click Start Early Timing Estimate to generate initial compilation results after you have run analysis and synthesis.</p>
5.	<p data-bbox="503 1077 1323 1140"><input type="checkbox"/> <i>Consider the following recommendations for timing optimization and analysis assignment:</i></p> <ul data-bbox="548 1150 1425 1717" style="list-style-type: none"> <li data-bbox="548 1150 1425 1213">■ Turn on Optimize multi-corner timing on the Fitter Settings page in the Settings dialog box. <li data-bbox="548 1224 1425 1287">■ Use <code>create_clock</code> and <code>create_generated_clock</code> to specify the frequencies and relationships for all clocks in your design. <li data-bbox="548 1297 1425 1360">■ Use <code>set_input_delay</code> and <code>set_output_delay</code> to specify the external device or board timing parameters <li data-bbox="548 1371 1425 1455">■ Use <code>derive_pll_clocks</code> to create generated clocks for all PLL outputs, according to the settings in the PLL IP cores. Specify multicycle relationships for LVDS transmitters or receiver deserialization factors. <li data-bbox="548 1465 1425 1528">■ Use <code>derive_clock_uncertainty</code> to automatically apply inter-clock, intra-clock, and I/O interface uncertainties. <li data-bbox="548 1539 1425 1602">■ Use <code>check_timing</code> to generate a report on any problem with the design or applied constraints, including missing constraints <li data-bbox="548 1612 1425 1675">■ Use the Quartus II optimization features to achieve timing closure or improve the resource utilization. <li data-bbox="548 1686 1425 1717">■ Use the Timing and Area Optimization Advisors to suggest optimization settings. <p data-bbox="548 1728 1425 1780">For more guidelines about timing constraints, refer to <i>The Quartus II TimeQuest Timing Analyzer</i> chapter in the <i>Quartus II Handbook</i>.</p>

Functional and Timing Simulation

Use the following checklist for guidelines about functional and timing simulation.

Table 15. Functional and Timing Simulation Checklist

No.	✓ Checklist items
1.	<input type="checkbox"/> <i>Perform functional simulation at the beginning of your design flow</i> Perform the simulation to check the design functionality or logical behavior of each design block. You do not have to fully compile your design; you can generate a functional simulation netlist that does not contain timing information.
2.	<input type="checkbox"/> <i>Perform timing simulation to ensure your design works in targeted device</i> Timing simulation uses the timing netlist generated by the TimeQuest Timing Analyzer, which includes the delay of different device blocks and placement and routing information. You can perform timing simulation for the top-level design at the end of your design flow to ensure that your design works in the targeted device.
3.	<input type="checkbox"/> <i>Specify your simulation tool and use correct supported version</i> <ul style="list-style-type: none"> ■ Altera provides the ModelSim®-Altera simulator Starter Edition and offers the higher-performance ModelSim-Altera Edition that enable you to take advantage of advanced testbench capabilities and other features. ■ In addition, the Quartus II EDA Netlist Writer can generate timing netlist files to support other third-party simulation tools such as Synopsys VCS, Cadence NC-Sim, and Aldec Active-HDL. ■ If you use a third-party simulation tool, use the software version that is supported with your Quartus II software version. ■ Specify your simulation tool in the EDA Tools Settings page of the Settings dialog box to generate the appropriate output simulation netlist. The software can also generate scripts to help you setup libraries in your tool with NativeLink integration. ■ Use only the model libraries provided with your Quartus II software version. Libraries may change between versions and this can cause a mismatch with your simulation netlist. ■ To create a testbench in the Quartus II software, on the Processing menu, point to Start and click Start Testbench Template Writer. <p>For information about the officially supported version of each simulation tool in a Quartus II software version, refer to the relevant Quartus II software release notes on the Release Notes page at the Altera website.</p> <p>For more information, refer to the following documents in the <i>Quartus II Handbook</i>:</p> <ul style="list-style-type: none"> ■ Simulating Altera Designs ■ Mentor Graphics ModelSim and QuestaSim Support ■ Synopsys VCS and VCS MX Support ■ Cadence Incisive Enterprise Simulator Support ■ Aldec Active-HDL and Rivera-PRO Support

Formal Verification

Use the following guidelines if your design requires formal verification.

Table 16. Formal Verification Checklist

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Determine if you require formal verification for your design</i></p> <p>If formal verification is required for your design, it is easier to plan for limitations and restrictions in the beginning than to make changes later in the design flow.</p>
2.	<input type="checkbox"/>	<p><i>Check for support and design limitations for formal verification</i></p> <p>The Quartus II software supports some formal verification flows. Using a formal verification flow can impact performance results because it requires that certain logic optimizations be turned off, such as register retiming, and forces hierarchy blocks to be preserved, which can restrict optimization.</p> <p>For more information, refer to the Cadence Encounter Conformal Support chapter in the <i>Quartus II Handbook</i>.</p>
3.	<input type="checkbox"/>	<p><i>Specify your formal verification tool and use correct supported version</i></p> <p>Specify your formal verification tool in the EDA Tools Settings page of the Settings dialog box to generate the appropriate output netlist.</p> <p>For information about the officially supported version of each formal verification tool in a Quartus II software version, refer to the relevant Quartus II software release notes on the Release Notes page at the Altera website.</p>

Power Analysis and Optimization

After compiling your design, analyze the power consumption and heat dissipation with the Quartus II PowerPlay Power Analyzer to calculate the dynamic, static, and I/O thermal power consumption and ensure the design has not violated power supply and thermal budgets.

Power optimization in the Quartus II software depends on accurate power analysis results. Use the following guidelines to ensure the software optimizes the power utilization correctly for the design's operating behavior and conditions.

Table 17. Power Analysis and Optimization Checklist (Part 1 of 3)

No.	✓	Checklist items
1.	<input type="checkbox"/>	<p><i>Provide accurate typical signal activities to get accurate power analysis result</i></p> <p>You need to provide accurate typical signal activities to PowerPlay Power Analyzer:</p> <ul style="list-style-type: none"> ■ Compile a design to derive the information about design resources, placement and routing, and I/O standards. ■ Derive signal activity data (toggle rates and static probabilities) from simulation results or a user-defined default toggle rate and vectorless estimation. The signal activities used for analysis must be representative of the actual operating behavior. <p>For the most accurate power estimation, use gate-level simulation results with a Value Change Dump File (.vcd) output file from a third-party simulation tool. The simulation activity should include typical input vectors over a realistic time period and not the corner cases often used during functional verification. Use the recommended simulator settings, such as glitch filtering, to ensure good results.</p>
2.	<input type="checkbox"/>	<p><i>Specify the correct operating conditions for power analysis</i></p> <p>Specify the operating conditions, including the core voltage, device power characteristics, ambient and junction temperature, cooling solution, and the board thermal model.</p> <p>In the Quartus II software, select the appropriate settings on the Operating Settings and Conditions page in the Settings dialog box.</p>
3.	<input type="checkbox"/>	<p><i>Analyze power consumption and heat dissipation in the PowerPlay Power Analyzer</i></p> <p>In the Quartus II software, on the Processing menu, click PowerPlay Power Analyzer Tool. The tool also provides a summary of the signal activities used for analysis and a confidence metric that reflects the overall quality of the data sources for signal activities.</p> <p>For more information about power analysis and recommendations for simulation settings for creating signal activity information, refer to the <i>PowerPlay Power Analysis</i> chapter in the <i>Quartus II Handbook</i>.</p> <p>The PowerPlay Power Analyzer report is a power estimate and is not a power specification. Always refer to the device datasheet for the power specification.</p>
4.	<input type="checkbox"/>	<p><i>Review recommended design techniques and Quartus II options to optimize power consumption</i></p> <p>For information about design techniques to optimize power consumption, refer to the <i>Power Optimization</i> chapter of the <i>Quartus II Handbook</i>.</p>

Table 17. Power Analysis and Optimization Checklist (Part 2 of 3)

No.	✓	Checklist items
5.	<input type="checkbox"/>	<p><i>Use the Power Optimization Advisor to suggest optimization settings</i></p> <p>The Power Optimization Advisor provides specific power optimization advice and recommendations based on the current design project settings and assignments. For more information, refer to the <i>Power Optimization</i> chapter in the Quartus II Handbook.</p>
6.	<input type="checkbox"/>	<p><i>Consider using a faster speed grade device</i></p> <p>If your design includes many critical timing paths that require the high-performance mode, you might be able to reduce power consumption by using a faster speed grade device if available. With a faster device, the software might be able to set more device tiles to use the low-power mode.</p>
7.	<input type="checkbox"/>	<p><i>Optimize the clock power management</i></p> <p>Clocks represent a significant portion of dynamic power consumption, because of their high switching activity and long paths. The Quartus II software automatically optimizes clock routing power by enabling only the portions of a clock network that are required to feed downstream registers.</p> <p>You can also use clock control blocks to dynamically enable or disable the clock network. When a clock network is powered down, all the logic fed by that clock network does not toggle, thereby reducing the overall power consumption of the device.</p> <p>For more information about using clock control blocks, refer to the <i>MAX 10 Clocking and PLL User Guide</i>.</p> <p>To reduce LAB-wide clock power consumption without disabling the entire clock tree, use the LAB-wide clock enable signal to gate the LAB wide clock. The Quartus II software automatically promotes register-level clock enable signals to the LAB level.</p>
8.	<input type="checkbox"/>	<p><i>Reduce the number of memory clocking events</i></p> <p>Reduce the number of memory clocking events to reduce memory power consumption. You can use clock gating or the clock enable signals in the memory ports.</p>

Table 17. Power Analysis and Optimization Checklist (Part 3 of 3)

No.	✓	Checklist items
9.	<input type="checkbox"/>	<p><i>Consider the following I/O power guidelines:</i></p> <ul style="list-style-type: none"> ■ The dynamic power consumed in the I/O buffer is proportional to the total load capacitance—lower capacitance reduces power consumption. ■ Dynamic power is proportional to the square of the voltage. Use lower voltage I/O standards to reduce dynamic power. Non-terminated I/O standards such as LVTTL and LVC MOS have a rail-to-rail output swing equal to the V_{CCIO} supply voltage and consume little static power. ■ Dynamic power is proportional to the output transition frequency. Use resistively-terminated I/O standards such as SSTL for high-frequency applications. The output load voltage swings by an amount smaller than the V_{CCIO} around a bias point. Because of this, the dynamic power is lower than for non-terminated I/O under similar conditions. ■ Resistively-terminated I/O standards dissipate significant static power because current is constantly driven into the termination network. Use the lowest drive strength that meets your speed and waveform requirements to minimize static power when using resistively terminated I/O standards. ■ The power used by external devices is not included in the PowerPlay Power Analyzer calculations. Ensure that you include the external devices power separately in your system power calculations.
10.	<input type="checkbox"/>	<p><i>Reduce design glitches through pipelining and retiming</i></p> <p>A design that has many glitches consumes more power because of faster switching activity. Pipelining by inserting flip flops into long combinational paths can reduce design glitches.</p> <p>However, if there are not many glitches in your design, pipelining may increase power consumption due to the addition of unnecessary registers.</p>
11.	<input type="checkbox"/>	<p><i>Review the information on power-driven compilation and Power Optimization Advisor</i></p> <p>For more information, refer to the <i>Power Optimization</i> chapter in the Quartus II Handbook.</p>
12.	<input type="checkbox"/>	<p><i>Reduce power consumption with architectural optimization</i></p> <p>Use specific device architecture features to reduce power consumption.</p> <p>For example, use the dedicated DSP block available in the MAX 10 device in place of LEs to perform arithmetic-related functions; build large shift registers from RAM-based FIFO buffers instead of building the shift registers from the LE registers.</p>
